

Reduce function accepts two arguments, the function to perform the execution and the data to iterate over.

Unlike **filter** and **map**, **reduce** iterates two items/elements at a time instead of one.

The result of reduce is to always return a single result.

Syntax: `reduce(fun, sequence)`

```
lst = [12, 14, 16, 4, 18]
```

```
x = 12
```

```
y = 14
```

```
if x<y:
```

```
    print(x) # 12
```

```
else:
```

```
    print(y)
```

```
x = 12
```

```
y = 16
```

```
if x<y:
```

```
    print(x) # 12
```

```
else:
```

```
    print(y)
```

```
x = 12
```

```
y = 4
```

```
if x<y:
```

```
    print(x) # 4
```

```
else:
```

```
    print(y)
```

```
x = 4
```

```
y = 18
```

```
if x<y:
```

```
    print(x) # 4
```

```
else:
```

```
    print(y)
```

Case Study

```
from functools import reduce
```

```
lst = [12, 14, 16, 4, 18]
```

```
# find the sum of all numbers
```

```
r = reduce(lambda x, y: x+y, lst)
```

```
print(r) # 64
```

```
# 12 + 14 = 26
```

```
# 26 + 16 = 42
```

```
# 42 + 4 = 46
```

```
# 46 + 18 = 64
```

```
# find the lowest value
```

```
r = reduce(lambda x, y: x if (x < y) else y, lst)
```

```
print(r) # 4
```
